Accessibility and Connectivity of Bike Paths to Select Facilities for Bronx, NY Residents

Spring 2020: Geostatistics; Professor Musa

By: Caitlyn J. Linehan

Background and Introduction

- People that engage in physical activity can greatly reduce the risk of different diseases as well as reducing stress and anxiety.
- Biking is a great form of physical activity that provides these benefits.2
- A deterrent to urban biking is a lack of a connected bike path.
- This case study will use network analysis on the accessibility of a low stress bike network in the Bronx to access select facilities (parks, recreation centers, and libraries) that promote well being.
- When access to areas where physical activities are promoted are increased as well as educational outreach there is a significant increase in the occurrence of physical activity done.3
- I. (Gies 2006) 2. (Götschi et. Al 2016) 3. (Kahn et. Al 2002)

Background and Introduction

I. (Gies 2006) 2. (Götschi et. Al 2016) 3. (Kahn et. Al 2002)

Research Questions

I. Determine stress imposed on cyclist due to a street link based on street type, speed limit, number of travel lanes, slope, and bicycle accommodation.

2a. What is the access of park entrances to Bronx, NY cyclists using a low stress bicycle network?

2b.What is the access of libraries to Bronx, NY cyclists using a low stress bicycle network?

2c.What is the access of recreation centers to Bronx, NY cyclists using a low stress bicycle network?

Methods

- I. Cleaning the Street Data
- 2. Defining the Low Stress Network
- 3. Integrating Slope in the Low Stress Network
- 4. Making the Network in ArcMap
- 5. OD Cost Matrix: Defining the origins
- 6. OD Cost Matrix: Defining the destinations
- 7. OD Cost Matrix: Calculating the OD Matrix
- 8. OD Cost Matrix: Assessing the Results

Answers question I. Determine stress imposed on cyclist

Answers question 2. Access of park entrances, libraries, and recreation centers

**Methodology based on a paper by Lowry et. al 2016

I. Cleaning the Street Network and Edge Effect

 Found that the average distance that a resident in Sweden would travel to recreational forested parks is 3.5 km or approximately 2 miles.

- LION Street
 Dataset
- Westchester Roads (from the Census)

- Clip to the 2 mile buffer border
 Remove Generic and Faux Segments
- Remove all Feature types except Streets
- Remove bridges that don't have bike accommodations
- Remove highways because bikes are not allowed on them.
- Remove roads in areas such as: Rikers Island, Bronx Zoo, and Botanical Gardens

I. Cleaning the Street Network and Edge Effect

buld travel to recreational

Clip to the 2 mile buffer border Remove Generic and Faux Segments Remove all Feature types except Streets Remove bridges that don't have bike accommodations

Remove highways because bikes are not allowed on them.

Remove roads in areas such as: Rikers Island, Bronx Zoo, and Botanical Gardens

2. Defining the Low Stress Network

- $F_{stress,e} = F_{roadway,e} \times (1 F_{bikeaccom,e})$
 - $F_{stress,e} = stress factor for link e$
 - *F_{roadway,e}* = roadway stress factor
 - F_{bikeaccom,e} = bicycle accomodation stress reduction factor for link e
- $F_{slope,e} = slope factor for link$
 - 37% if slope > 2%
 - 120% if slope > 4%
 - 320% if slope > 6%

- $F_{slope,e} + F_{stress,e} = Stress Level$
- Stress Level Threshold is 60%

Bicycling Comfort and Low Traffic Stress Levels

LTS 2 Threshold: 30%

LTS 3 Threshold: 60%

LTS 4 Threshold: No Max

**Methodology based on a paper by Lowry et. al 2016

Calculating Slope of Street Segments

Use the Feature Vertices to Points tool (once for the end of the street segment and another for the start of the street segment) Use a DEM and use the Extract Values to Points tool to get the elevation value for the

beginning and

end point

Join Point Data with Start and End Elevation to Street Network Calculate slope percent:

 $\frac{End \ Elevation - Start \ Elevation}{Segment \ Length} \times 100$

3. Using slope in our LTS network

4. Making the Network in ArcMap

4. Making the Network in ArcMap

Add and calculate the redefined length field

 $NewW_eLength = L_e(1 + F_{slope,e} + F_{stress,e})$ $NewW_eLength = Impedence \ length \ factor \ of \ link \ e$ $L_e = length of link e$ $F_{stress,e} = stress factor for link e$ $F_{slope,e} = slope factor for link e$ Create a Network Dataset in ArcMap Evaluators \times Attribute: Length \sim Attribute Values: Source Values Default Values Source ! Direction Element Туре Value LTS_Network From-To Field Edge NewWlength LTS Network To-From Edge Field NewWlength

**Methodology based on a paper by Lowry et. al 2016

5. Defining the areas of origins (Tax Lot Data)

Performed Cadastral Based Expert Dasymetric System (CEDS) to estimate the Population at the Tax Lot level

> Residential Units at the Lot Level

- Residential Area at the Lot Level
- Population at the Census Tract Level

Data

Inputs

• Population at the Block Group Level

**Methodology based on a paper by Maantay et. al 2007

5.5 CEDS Method (Tax Lot Data)

Census Tract

Population= 40 people Total RU= 10 Total RA= 17,000 ft

Tax Lot 1	Tax Lot 2
RU=1	RU=2
RA= 1,000 ft	RA= 2,000 ft
Ta	x Lot 3
I	RU=7
RA=	14,000 ft

• $POP_l = POP_c \times \frac{U_l}{U_c}$

- *POP*_l = *Estimated Population at the Lot Level*
- *POP_c* = *Population at the Census Tract Level*
- $\frac{U_l}{U_c}$ = Ratio of the Residential Units at the Lot Level to the Residential Units of the Censust Tract Level
- * Repeat for the Residential Area

• $RU_POP_{diff} = |POP_{BG} - POP_{est}|$

 RU_POP_{diff} = Absolute Difference between Census Block Group Assessing Population and the estimated tax lot population based on Errors Residential Units aggregated to the Block Group

• If $RU_POP_{diff} \le ARA_{POP_{diff}}$, Then $POP_{lot} = CEDS$ POP_{RU_CT} , $Else POP_{lot} = POP_{ARA_CT}$

Estimating Population at the Tract Level

5.75 Assessment of CEDS Methods

6. Defining the Areas of Interest (Destinations)

7. OD Cost Matrix: Calculating the OD Matrix

Results:

Table that stated how many destinations (libraries/ recreation centers/parks) that a certain origin (singular tax lot) has reached

8. Assessing the Results

Percentage of Population With Bike Access to Libraries

8. Assessing the Results

Percentage of Population With Bike Access to Recreation Centers

8. Assessing the Results

Percentage of Population With Bike Access to Park Entrances

Percentage of Population With Bike Access to Park Entrances

Performed a Network Analysis with Park Walkability:

-Used Sidewalks as my network

-Defined walkability measure as $\frac{1}{4}$ of a mile

-See similar areas that have a lack of walkability and lack of bike access to parks

Issues to Consider: The Westchester Dilemma and Future Studies

- Westchester Road data didn't include speed limits or number of travel lanes.
- Number of travel lanes was declared as two
- Speed limit was generalized depending on what municipality it was in:
 - Mount Vernon: 25
 - Bronxville: 30
 - Pelham: 30
 - Yonkers: 30
 - Pelham Manor: 30
 - New Rochelle: 30

Future studies should include:

- Model Turn Restrictions
- Model Inherent Slow Downs at Intersections
- Model shifting in bike accommodations at intersections.
- Integrate traffic data into the low stress network
